

Muskrat

By Emily moffatt

Did you know the muskrat is 13-20 cm long? I will tell you about the muskrat. the muskrat is a small rodent. muskrats are important to Canada because their fur is very soft and people used to trade it. If you keep reading I will tell you about the muskrat habitat, diet, visual appearance and more.

Keep reading to see the muskrat's visual appearance. The muskrat has thick brown fur. they have chubby bodies. two small eyes. also two short round ears. keep reading to find out about the muskrat diet.

I will be talking about the diet of a muskrat. muskrats are omnivores. mostly eat plants like roots, stems, leaves, moss and fruits. though small aquatic animals like fish and fresh water claims amphibians (frog, snake, salamander, newt, axolotl, and olm) are often winter food for them. read more to find out the muskrat habitat.

I will be talking about the muskrat habitat. They live in freshwater like lakes and slow moving streams. Dried up leaves and plant mounds is a muskrat home. they also dig burrows in soft soil or clay. In winter they live two meters under water. muskrat homes are called pushups. read more to find out more facts about muskrats.

These are more facts about the muskrat. muskrats have 2-3 litters a year with 6-8 kits and can remain submerged for up to 17 mins. In the early 1900s millions of muskrats were trapped

and sold across the world. America and across North America. Over the past 150 years the muskrat has contributed more than any other animal.

That is all about the muskrat.i love muskrats because they are super cute.i hope you learned a thing or two bye!!!!!!!!!!!!!!!!!!!!
